

THE 12+7+12=31 GEOMETRY  
APPLIED TO 3 PERCUSSION KEYBOARDS

© 1975 by Erv Wilson  
1219 Poinsettia Dr. L.A. CA 90046

Because this geometry is not suited to manual keyboard design its usefulness for the percussion keyboard may be overlooked. In malletted instruments, such as vibes, marimba, and gamelan it provides a pattern that is easy to perform upon and one that is readily understood by players with conventional training. The tuning is by meantone Fifths ( $\frac{1}{4}$  comma small) or by the 31 equal-tempered Fifth of 18/31 Octave. The tuning series begins at F $\sharp$  in the near rank, passing thru all 12 members of the near rank it then proceeds to the middle rank where it traverses all 7 members, and then continues thru all 12 members of the far rank, ending on B $\flat$ . Thus:

|  |             |
|--|-------------|
| start  |             |
| F $\sharp$ C $\sharp$ G $\sharp$ D $\sharp$ A $\sharp$ E $\sharp$ B $\sharp$ G $\flat$ D $\flat$ A $\flat$ E $\flat$ B $\flat$ | NEAR RANK   |
| F C G D A E B  | MIDDLE RANK |
| F $\sharp$ C $\sharp$ G $\sharp$ D $\sharp$ A $\sharp$ F $\flat$ C $\flat$ G $\flat$ D $\flat$ A $\flat$ E $\flat$ B $\flat$   | FAR RANK    |
|  | END         |

and according to the accompanying diagrams.

THE CHROMASONG 31 is suited for 'vibes' and other metallophones made of flat bars having a long ring time, and where, therefore, damping is required. This is the classic foot-damper, and it damps the back 2 ranks with the principal damping bar. An auxiliary bar damps the front rank only. The shown diagram is a reduction of a layout for an instrument now in construction.

THE 31-TONE TUBULONGS is suited for metal, long tubes. A 2-Octave set has been cut from aluminum tubing 5/8" I.D. with a 1/16" wall thickness (of the type found quite inexpensively at the hardware store, used for electrical conduit). 1" round brass tubing with 1/32" wall thickness has an exquisitely lovely tone and a prolonged ring time, and I will use these in a three-Octave set. 1" square brass tubing is also an interesting material, but tends to go flat if hit too enthusiastically. Perhaps one should experiment also with polycarbonate (plastic) tubing.

THE 31-TONE MARIMBA is suited for xylophones, also, and for metallophones where damping is not required. This is a good pattern for 'song-bells', and where resonating troughs are used for each of the three ranks, would make a compact instrument for classroom use. I have not begun construction on any instrument using this configuration, but do look forward to seeing any of these instruments realized.

A possible source of these and other new percussion instruments may be Wm. Dreiman/Bill Marimba (Good Vibes Malletworks, Inc., 407 Dover Road, Rockville, Maryland 20850) who has expressed an interest in building these kinds of instruments.

A second possible source of these instruments may be Hackleman/Wilson Clavichord Works, 1219 Poinsettia Drive, Los Angeles, CA 90046.

# THE 31-TONE SCALE, MEANTONE CYCLE

## ITS MUSICAL RESOURCES AND PRACTICAL APPLICATION

Prepared by Ervin M. Wilson

Various historical instruments have been constructed, providing this very important temperament with a more or less effective keyboard. The keyboard diagram, Fig. I, provides a meaningfully organized arrangement of 31 digitals and optimum manual accessibility.

The musical advantage of the meantone cycle over the 12-tone cycle, for the classical idiom, is represented in Figure II.

The application of the 31-tone scale to significant melodic and harmonic developments is demonstrated in Figure III.

Traditional notation, in fact, invented for meantone and Pythagorean tunings, applies directly to this keyboard. The diagrammatic notation, Fig. IV, is very useful and easy to learn. Figure V is merely a sheet of notation paper for this scheme.

The 31-tone system, meantone cycle, will have wide appeal for the reasons listed below:

1. Simple and eloquent aural preference.
2. The wide acceptance of meantone tuning in Europe for hundreds of years. The vast body of musical literature conceived in this tuning.
3. Superior orchestral and choral accompaniment, for the concert hall or the church choir.
4. The ease with which the musician may transfer his past learning from a 12-tone context to a 31-tone context.
5. The logical extension of significant melodic and harmonic possibility; this, in reconciliation with an accepted musical idiom, and in a single organized tonal system.
6. Greatly increased correspondence to historical and ethnic scales, including persistent Jazz inflection.
7. A stimulating medium for the composer, the experimentalist, and the everyday musical adventurer.
8. Obvious application to the eerie and special musical effects for the cinema, television, and radio.
9. Undiluted novelty.

The keyboard is a symmetrical arrangement of 31 digitals per octave, based upon the familiar pattern, and systematically tuned to 31-tone equal temperament.

While the 31-tone scale is thoroughly justified as the cyclic fulfillment of meantone temperament (all 31 intervals could be found on Handel's organ), it is a most fortunate and happy coincidence that the harmonic series is also approximated in this division with exceptional efficiency. It is, in fact, the first division of the octave to provide a satisfactory approximation of the harmonic series, 1 thru 16. Although the 13th is somewhat sharp, especially in relation to the 9th, it is not unbearably so. The series, 1 thru 12 is suited for harmonic synthesis; 1 thru 16 for melodic and general harmonic purposes; 1 thru 26 for chromatic melody & complex harmonic purposes (the 17th and 19th being quite sharp). Thus, good harmonic and melodic results are obtained by expanding the principle of the Major triad, harmonics 4, 5, & 6. Neither the 12-tone nor the 24-tone system provides even a suitable 7th harmonic!

By virtue of equal division the equivalent subharmonic series is also obtained. It so happens that the subharmonic series is the basis of a vast system of scales and modes derived from the equally divided string or the equally divided column of air (folk flutes, etc). These scales originated with the first cave dwellers who began boring equally spaced holes in their bone whistles; they are still found almost anywhere on Earth. (Ref: The Greek Aulos, Kathleen Schlesinger) Of the principle tones,  $\frac{1}{16}$  thru  $\frac{1}{6}$ , the 12-tone scale systematically censors the  $\frac{1}{14}$ th,  $\frac{1}{13}$ th,  $\frac{1}{11}$ th, & the  $\frac{1}{7}$ th. In the 31-tone system we are privileged to borrow not only the melodies, but also the beautiful scales of neighbors; from Peru, Turkey, Japan, Yugoslavia, Africa, Java, ---

In addition, the pentatonic, diatonic, chromatic, & enharmonic, (19-tone) species are inherent in the 31-tone division. These are provided, in this keyboard with logical and contiguous fingerings, and greater fingering homogeneity than is possible on the 12-tone keyboard.

JUST INTERVALS IN CLASSICAL CONTEXT COMPARED WITH 31-TONE EQUAL TEMPERAMENT  
 (12-TONE TEMP. REF. AT BOTTOM OF PAGE)

The Spurious condensation of our musical heritage into 12 equal tones has deprived us of the ratios of 11 and 13

# The Moments-of-Symetry of 31

Numerals merely indicate ascending panchromatic sequence.  
 Standard notation is shown in large print.  
 Exotic alteration is shown in type.

Example:    0.    1.    2.    3.    4.    5.  
               C    c +   C #   c f   C ·✘   D  
               C    D b b   D r   D b   D r   D

+ = hard; f = acute; r = grave; r = soft
